                                                                                                                                                                                                                                                                                                                         14-MAY-
   The invention relates to a polynucleotide isolated from chromosome 11 of Indica rice cultivar CO39, flanked by marker R2316 and 861094 comprising one or more genes that confer resistance to strains of Magnaporthe grisea having avirulence gene AVR1-CO39. The Pi-CO39(T) polynucleotides are useful for conferring or improving resistance of plants to strains of the rice blast pathogen. Magnaporthe grisea and other pathogens. The pi-CO39(T) nucleic acids may be used as probes to detect the presence of pure Pi-CO39(T) proteins. Purified gene products of Pi-CO39(T) are useful in producing polyclonal or monoclonal artibodies useful as sensitive detection reagents for the presence and accumulation of Pi-CO39(t) are useful for plant breading or directly in agricultural or horitualtural applications. The present sequence is BAC clone K6936 from rice variety CO39.
                                                                                                                                                                                                                                                                                                                                                                                          33772

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel nucleic acid of Arabidopsis thaliana comperising a sequence capable of hybridising under stringency to one of the 999 sequences referred to but not defined in the specification (ABQ85131-ABQ86129). The nucleic acid sequences are useful to identify homologous or related genes, to produce compositions that modulate expression or function of the encoded protein, to map functional regions of the protein, to study associated physiological pathways, to genetically manipulate cells and plants. The encoded products are useful to screen for biologically active agents such as fungicides or insecticides and to elucidate biochemical pathways.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1214 GAGAAGGTGAAGGAGCACATCGAGGAGGAGGGGGGGAGGAGCAGTGGCGAAGCACAGCCAG 1273

Also included are the RCI-1 cDNA, its encoded protein, a 4.5kb genomic clone for the lipoxygenase grene, promoter fragments, the lipoxygenase transit peptide which directs expressed proteins to the plastid, a vector comprising the promoter or fragments and a transgenic plant comprising the vector. The promoter or fragments are useful for expressing a nucleotide sequence of interest. The transit peptide is useful for targeting an associated protein of interest to plastids. A nucleic acid which expresses polypeptide having lipoxygenase activity is useful for inhibiting fungal mycotoxins when transformed into a plant. The lipoxygenase is useful for inhibiting fungal mycotoxins when transformed into a plant. The useful for regulating transcription of a chemically inducible but not wound or pathogen inducible gene, which involves applying a chemical

regulator to a plant or seed containing a chemically regulatable nucleotide sequence. Transgenic plants as described above are useful for breeding improved plant lines that for example increases the effectiveness of conventional methods such as herbicide or pesticide treatment or allow to dispense with the methods due to their modified genetic properties. New crops with improved stress tolerance can be obtained that, due to their petinised genetic equipment yield harvested product of better quality than products that were not able to tolerate comparable adverse developmental conditions. The present sequence is the 4.5kb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Arabidopsis thaliana, thale cress, plant; transgenic; GMO; disease; stress; metabolic pathway; biosynthetic pathway; nutrition; fungicide; insecticide; antibiotic; ds.

                                                                                                                                                                                                                                                           The invention relates to nucleic acids (I) that hybridise under stringent conditions to any of 999 sequences (ABQ65424-ABQ66422) or their fragments. (I) are used to express the corresponding polypeptides (II) or to produce genetically modified plant cells or transgenic plants, which may have improved resistance to disease or stress, or altered metabolic/biosynthetic pathways (for production of commercial, nutritional or medicinal products), or generally any trait of interest, or can be used to screen for biologically active agents (e.g. fungicides, insecticides and antibiotics).

This invention relates to a sakuranetin synthetase gene encoding a protein with naringenin 7-0-methyltransferase (NOMT) sctivity and promoter activity. The invention includes a recombinant vector including the sakuranetin synthetase DNA and host cells transformed with the vector. The sakuranetin synthetase protein has antibacterial activity and is used to produce transpent plants with antibacterial characteristics. The present sequence represents the sakuranetin synthetase gene of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   960 TCAAATATTTTTAAGCATGACATAAACATTTTTCATATTTGCAAAA-----AAAAAAA 1012

                                                                                                                                                                                                                                                                                    The sequence is that of the MLO gene, wild-type MLO exerts a negative regulatory function on a pathogen defence response, such that mutants exhibit a defence response in the absence of pathogen. Down-regulation or our cour-competition of MLO function may be used to stimulate a defence response in transgenic plants conferring increased pathogen resistance, especially resistance to powdery mildew or rust. The product can also he used for identifying compounds able to stimulate a defence response in a plant by interaction with encoded polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1971 ATTYAAAAAATTYAAAGTAATTATTAATTCTTTTTCTACCATTGGATTCCTAAATAT 2030

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to gcpE nucleic acid molecule, an essential gene of methyl-D-erythritol phosphate (MEP) pathway) that encodes rice, Arabidopsis thalians or Escherichia coli GCPE protein. GropE is useful for producing a transgenic plant such as Brassica campestris. B. napus, canola, castor bean, coconut, cotton, crambe, linseed, maize, mustard, cill palm, peanut, rapessed, rice, safflower, sesame, soybean, sunflower, or wheat with an increased isopremoid (tocopherol) compound level. The expression of GCPE protein in organisms increases the level of tocopherol substrate such as isopentyl diphosphate and dimethylallyl diphosphate biosynthesis. Transgenic organisms overexpressing GCPE protein in transgenic organisms overexpressing GCPE protein in transgenic plant may provide tolerance to stresses of GCPE protein in transgenic plant may provide tolerance to stresses of GCPE protein in transgenic plant may provide tolerance to stresses colerance such as to oxygen or ozone, UV colerance, etc. gcpE may be used to obtain nucleic acid molecules from the same species, and to obtain nucleic acid homologues. gcpE is also used as or primers. The recombinant vectors are used in plant transformation or transfection. gcpE an also act as markers capable of detecting polymorphisms such as single nucleotide polymorphisms (SNPs).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16638 AAIGGTCAAACAIGTGCTAAAAGTTAACGGTGTAAAATATTTAGAAACGGAGGAAGTAI 16579

The invention relates to a polynucleotide isolated from chromosome 11 of Indica rice cultivar CO39, flanked by marker R2316 and RG1094 comprising one or more genes that confer resistance to strains of Magnaporthe grisea having avirulence gene AVR1-CO39. The P1-CO39(t) polynucleotides are useful for conferring or improving resistance of plants to strains of the rice blast pathogen, Magnaporthe grisea and other pathogens. The P1-CO39(t) nucleic acids may be used as probes to detect the presence of p1-CO39(t) nucleic acids may be used as probes to detect the presence of pure P1-CO39(t) proteins. Purified gene products of P1-CO39(t) are useful in producing polyclonal or monoclonal antibodies useful as sensitive detection reagents for the presence and accumulation of P1-CO39(t) polypeptides. The transgenic plants are useful for plant breeding or directly in agricultural or hortcultural applications. The present sequence is BAC clone E2P5 from rice variety CO39.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              65529 cerecereceraararrigaegecerraacririraaarargrirgaregrieterer 65470

```
inducible expression of an ascolated nucleotide sequence. Also included are the RCI-1 cDNA, its encoded protein, a 4.5kb genomic clone for the lipoxygenase gene, promoter fragments, the lipoxygenase transit peptide which directs expressed proteins to the plastid, a vector comprising the promoter or fragments and a transgenic plant comprising the vector. The promoter or fragments are useful for expressing a nucleotide sequence of interest. The transit peptide is useful for targeting an associated protein of interest to plastids. A nucleic acid which expresses polypeptide having lipoxygenase activity is useful for inhibiting fungal mycotoxins when transformed into a plant. The lipoxygenase is useful for inhibiting fungal mycotoxins when transformed into a plant or the promoter is useful for regulating transcription of a chemically inducible but not cound or pathogen inducible gene, which involves applying a chemical crowled sequence. Transgenic plants as described above are useful for breading improved plant lines that for example increase the effectiveness
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of conventional methods such as herbicide or pesticide treatment or allow to dispense with the methods due to their modified genetic properties.
invention relates to an isolated nucleic acid molecule (a promoter of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           quality than products that were not able to tolerate comparable adverse developmental conditions. The present sequence is the 4.5\mathrm{kb}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      due to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  one or more genes that confer resistance to strains of Magnaporthe grisse having avirulence gene AVRI-CO39. The Pi-CO39(t) polynucleotides are useful for conferring or improving resistance of plants to strains of the rice blast pathogen. Magnaporthe grisse and other pathogens. The Pi-CO39(t) nucleic acids may be used as probes to detect the presence of and/or expression of Pi-CO39(t) genes, and to produce large quantities of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a polynucleotide isolated from chromosome 11 of Indica rice cultivar CO39, flanked by marker R2316 and RG1094 comprising

     pure Pi-CO39(t) proteins. Purified gene products of Pi-CO39(t) are useful in producing polyclonal or monoclonal antibodies useful as sensitive detection reagents for the presence and accumulation of Pi-CO39(t) polypeptides. The transgenic plants are useful for plant breeding or directly in agricultural or hortkoultural applications. The present sequence is BAC clone K6P36 from rice variety CO39.

                                                                                                                                                                             The present sequence, Pr-10c, is a pathogen inducible regulatory element. It was identified by screening a Co39 rice seedling appeared in library with a cDNa clone, MAG-7 of a gene whose transcripts appeared in Co39 rice seedlings 72 hours after incoulation with Magnaporthe grisea. Induced expression of the Pr-10c gene was not detected after infection with M. grisea throughout a 144 hour time period. The Pr-10c sequence is used to make a novel plant expression vector comprising a pathogen-inducible regulatory element and a core promoter, where the regulatory element is selected from three rice genomic DNA sequences AMI93778-80. The vectors are used for increasing the disease resistance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CATCAAATATTTTTAAGCATGACATAAACATTTTCATATTTGCAAAA------AAAAA 1010

                                                                                                                                                                                                                                                                                                                                                                                                      genome of rice, three times larger than that of Arabidopsis, makes it suitable for genomic studies. In order to facilitate positional cloning, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety. The library onotains 36,864 clones with an average insert size of 128.5 KD providing 10.9 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Two high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening."

COMPUTER: IBM PC compatible
SOFRATING SISTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NOMBER: US/08/781,891
FLING DATE: 27-DEC-1996
CLASSIFICATION: 800
                                                                                                                                                                                                                                    REFERENCE/DOCKET NUMBER: 240052.419
TELECOMMUNICATION INFORMATION:
TELEPRONE: (206) 622-4900
TELEPRA: (206) 682-6031
INFORMATION FOR SEQ ID NO: 209:
SEQUENCE CHARACTERISTICS:
LENGTH: 51259 base pairs
TYPE: nucleic acid
STRANDEDNESS: single
                                                                                                                                                                        ATTORNET AGENT INFORMATION:
